Roll Number of Student: 2410030764

Name of Student: SAHIL SHARMA

Batch: 2024-28

2026-27

CANDIDATE'S DECLARATION

I, Sahil Sharma, hereby declare that this internship report, titled “AWS Service Explorer: An Interactive Web Application for Exploring AWS Cloud Services,” is the result of my own work, carried out as part of my B.Tech (Computer Science and Engineering) internship. Wherever I have referred to other sources, I have acknowledged them. This report has not been submitted anywhere else for any other degree or diploma, and I take full responsibility for its originality.

Signature: _____

Student Name: Sahil Sharma

Roll No.: 2410030764

ACKNOWLEDGEMENT

I'd like to thank everyone who guided and supported me through the AICTE–EduSkills Virtual Internship Program in AWS Cloud Business Application. Their feedback and suggestions along the way helped me understand the concepts better and shape this project into something I could actually build and explain confidently.

I'm also grateful to IILM University, Greater Noida, and the School of Computer Science and Engineering for giving me this opportunity as part of my B.Tech curriculum.

Finally, a special thanks to my parents for their constant encouragement and support throughout this internship.

4. PROJECT DESCRIPTION

4.1 Introduction

AWS Service Explorer is a small web application I built using Python and Streamlit to make it easier to learn about AWS cloud services. Instead of digging through pages of official documentation, a user can open the app, pick a service, and instantly see what it does, what its key features are, and where it's typically used in real businesses. The goal was to keep things simple there's no AWS account setup or configuration needed to use it, so anyone can explore and learn from it right away.

4.2 Organization Profile

This project was developed as part of an internship with EduSkills, an organization that runs skill-based learning programs and internships for students. The program I joined the AICTE–EduSkills Virtual Internship Program in AWS Cloud Business Application ran for eight weeks and combined weekly learning modules, assessments, and hands-on project work covering different areas of AWS.

4.3 Problem Statement

AWS offers a huge catalog of cloud services, and for someone just starting out, that can feel overwhelming. It's not always obvious what a service is meant for, how it differs from a similar-sounding one, or where it would actually be used in a business setting. What's often missing is a simple, beginner-friendly way to look at a handful of services side by side and understand them without wading through dense technical documentation.

4.4 Project Objectives

Here's what I set out to achieve with this project:

- Build a simple, working web application for exploring AWS services.
- Present clear, beginner-friendly information about each selected service.
- Highlight the key features and business use cases for every service.
- Let users search for a service by name or category instead of scrolling through everything.
- Add a way to compare two services side by side.
- Keep the whole interface easy enough for someone new to AWS to use without help.

4.5 Scope of the Project

Right now, the app covers exploring services, searching, comparing two services at a time, and browsing categories, key features, and business applications for each one. It's intentionally kept simple all the data is stored locally rather than pulled from AWS in real time.

That said, there's clear room to grow it further connecting it to live AWS APIs, adding more services beyond the current eight, or pulling in real-time cloud usage data would all be natural next steps.

4.6 Technologies and Tools Used

The table below lists what went into building this project. One thing worth noting: none of it required a paid AWS service everything was built and tested for free.

Table 4.1: Technologies and Tools Used

Technology / Tool	Purpose
Python	Main programming language
Streamlit	Web application interface
VS Code	Development environment
Python Dictionary	Stores AWS service information
GitHub	Version control and hosting

4.7 System Architecture

The flow is pretty straightforward: the user interacts with the Streamlit interface, types in a search or picks a service, and the app looks that up against the stored service data. Whatever matches whether it's a single service's details or a side-by-side comparison gets displayed right back on the screen.

Figure 4.1: System Architecture of AWS Service Explorer

4.8 Methodology

I followed a fairly standard development flow while building this:

1. Figured out what the app actually needed to do (requirement analysis).
2. Gathered and organized information about each AWS service.
3. Sketched out how the app should be structured (system design).
4. Wrote the core application in Python and Streamlit.
5. Added the search, compare, and dashboard features one by one.
6. Tested everything to catch bugs and fix rough edges.
7. Ran the app locally for demonstration.

4.9 Expected Outcomes

By the end of this project, I have a working AWS Service Explorer that makes it noticeably easier for a beginner to understand what different AWS services actually do. It organizes the information in a way that's easy to scan, lets users search and compare services quickly, and just as importantly gave me hands-on practice building a real application with Python and Streamlit while reinforcing what I learned about AWS during the internship.

Internship Offer Letter

Student Name : Sahil Sharma
Stream : B.Tech
Branch : B.Tech(Computer Science and Engineering)
Institute Name : IILM University, Greater Noida
Internship Domain : AWS Cloud Business Application
Internship Duration : April 2026 - June 2026
AICTE Student ID : STU69ccea256f5e91775036965

We are pleased to inform you that you have been selected for the 8-Week **AICTE – EduSkills Virtual Internship Program**.

During this internship, you will learn and demonstrate industry-relevant skills that will enhance your employability and strengthen your confidence in the subject area.

The program is designed to provide structured learning combined with practical exposure.

Internship Structure & Evaluation:

- The internship will follow a **week-wise structured learning plan**.
- You will be required to complete **weekly assessments** to track your progress and understanding.
- Certain modules will require submission of **project documentation and assignments**.
- In the final week, you must appear for a **Final Assessment Test**.
- The final grade will be based on your overall performance, including weekly assessments, project submissions, and the final test.

Upon successful completion of all required steps and assessments, you will be awarded a **Virtual Internship Certificate**.

Please note that this offer letter will be considered valid only after the successful completion of the internship program and fulfillment of all assessment requirements, including obtaining the final completion certificate. Without the final completion certificate, this offer letter shall not be treated as a valid document for any official purpose.
